CROSS REFERENCE TO RELATED APPLICATION

This is a Continuation of U.S. application. Ser. No. 14/347, 178 filed Mar. 25, 2014 which is a National Stage Entry of PCT International Application No. PCT/JP2012/074968 filed Sep. 27, 2012, which claims benefit of Japanese Patent Application No. 2011-213987 filed Sep. 29, 2011 of which disclosures are incorporated herein by reference in their entirety.

TECHNICAL FIELD

The present invention relates to a compound represented by the formula (I-1):

[C 1]

wherein all the symbols have the same meanings as described hereinbelow, and a salt thereof, a solvate thereof, an N-oxide thereof or a prodrug thereof (hereinafter sometimes abbreviated as the present compound).

BACKGROUND ART

Sphingosine-1-phosphate [(2S,3R,4E)-2-amino-3-hydroxyoctadeca-4-enyl-1-phosphate; hereinafter sometimes abbreviated as S1P] is a lipid which is synthesized by metabolic turnover of sphingolipids or extracellular action of secretory sphingosine kinases. It is proposed that this lipid acts as an intercellular transmitter and an intracellular secondary transmitter.

With regard to S1P₂ (EDG-5/AGR16/H218) receptors among S1P receptors, it has been published that the strong expression of mRNA thereof is confirmed in tissues of heart, lung, stomach and small intestine and that the expression amount of mRNA thereof in intimal cells in model mice of carotid balloon injury which are the model for coronary arteriosclerosis is significantly decreased compared to normal intimal cells (see Patent Document 1).

It is also reported that S1P receptors (particularly S1P₂ receptors) are involved in portal hypertension, asthma and the like (see Non Patent Document 1). It is also known that the receptors are involved in expression of connective tissue growth factors (CTGFs) associated with onset of fibrosis, cancer and the like (see Non Patent Document 2).

The following compounds are known as the related art of the present invention.

(6) Deprotection reaction using a metal complex is carried out, for example, in an organic solvent (e.g. dichloromethane, N,N-dimethylformamide, tetrahydrofuran, ethyl acetate, acetonitrile, dioxane and ethanol), water or a mixed solvent thereof in the presence of a trap reagent (e.g. tributyltin hydride, triethylsilane, dimedone, morpholine, diethylamine and pyrrolidine), in the presence of an organic acid (e.g. acetic acid, formic acid and 2-ethylhexanoic acid) and/or a salt of an organic acid (e.g. sodium 2-ethylhexanoate and potassium 2-ethylhexanoate), in the presence or absence of a phosphine reagent (e.g. triphenylphosphine), with using a metal complex (e.g. tetrakis triphenylphosphine palladium (0), bis (triphenylphosphine)palladium (II) dichloride, palladium (II) acetate and tris(triphenylphosphine)rhodium (I) chloride) at 0 to 40° C.

Alternatively, the deprotection reaction can be carried out by the method described in, for example, T. W. Greene, *Protective Groups in Organic Synthesis*, Wiley, New York, 1999.

In the reactions described herein, reactions accompanied by heating can be carried out, as apparent to a person skilled in the art, with a water bath, an oil bath, a sand bath or a microwave.

In the reactions described herein, a solid phase immobilized reagent which is immobilized on a high molecular polymer (e.g. polystyrene, polyacrylamide, polypropylene and polyethylene glycol) may be used.

In the reactions described herein, reaction products can be purified according to a conventional purification means such as distillation at normal or reduced pressure, high performance liquid chromatography using silica gel or magnesium silicate, thin layer chromatography, ion exchange resins, scavenger resins or column chromatography or washing and re-crystallization. The injections may further contain a stabilizer, a solution adjuvant (e.g. glutamic acid, aspartic acid and Polysolvate 80®), a suspending agent, an emulsifying agent, a soothing agent, a buffering agent, a preservative and the like. The injections are produced by sterilization at the final stage or through an aseptic manipulation. Alternatively, aseptic solid formulations, for example freeze-dried formulations, may be produced which may be

Under an argon atmosphere and at room temperature, in a 500-mL pear-shaped evaporating flask, 4-fluorophenol (18.5 g) and 1,3-difluoro-5-nitrobenzene (25.0 g) were dissolved in DMA (300 mL). The reaction system was added with cesium carbonate (15.3 g) and stirred. The reaction system was then heated to 50° C., stirred for 3 hours, then heated to 65° C., stirred for 1 hour and further heated to 85° C. and stirred for 1 hour. The reaction solution was allowed to cool to room temperature, diluted with ethyl acetate and added with water to extract an organic layer. The aqueous layer was added with ethyl acetate to extract an organic layer. The organic layer was combined and washed with water and a saturated sodium chloride solution and the solvent was then distilled off under

The reaction solution was heated to 105° C. and stirred for 7 hours. The reaction solution was allowed to cool to room temperature, diluted with ethyl acetate and added with water to extract an organic layer. The organic layer was washed twice with water, twice with 1 N sodium hydroxide and with a saturated sodium chloride solution and then dried over anhydrous sodium sulphate and the solvent was distilled off under reduced pressure. The resulting residue was added with a seed crystal (5 mg) and the solid was precipitated under reduced pressure. The solid was added with hexane (300 mL), stirred and left to stand at room temperature to precipitate the solid. The solid was collected by filtration with a Kiriyaama funnel and washed with hexane. The resulting residue was dried under reduced pressure at 60° C. to give the titled compound (53.1 g). The filtrate was subjected to silica gel column chromatography (hexane:MTBE=99:1→95:5) to give a pale yellow oily substance. Re-crystallization was carried out with a mixed solvent of hexane and MTBE, and the titled compound (14.4 g) was obtained after filtration with a Kiriyaama funnel and washing with hexane. The titled compound having the following physical properties was obtained at a total amount of 67.5 g.

The mixture was heated to 75° C., added dropwise with methyl 1-bromocyclopropane carboxylate and further stirred at 75° C. for 2 hours (this solution is referred to as the solution 1). Under an argon atmosphere and at room temperature, N-methyl-2-pyrrolidone (NMP) (1.0 mL) was added, degassed and charged with argon. Bis(tri-tert-butylphosphine)palladium (0) (Pd(t-Bu₃P)₂) (23 mg) was added thereto, stirred for 10 minutes before addition of the compound prepared in Example 11 (200 mg). The mixture was heated to 95° C. and the solution 1 prepared as above was added dropwise over 30 minutes. The mixture was further stirred at 95° C. for 1.5 hours. EXPERIMENTAL EXAMPLES

The effects of the present compounds were verified based on the experimental methods shown hereinbelow as the biological experimental example and physical experimental example.

Biological Experimental Example 1

Evaluation of S1P₂ Antagonistic Activity by Monitoring the Change in Intracellular Calcium Ion Concentration

Chinese hamster ovary (CHO) cells overexpressing the human S1P₂ gene were cultured in a Ham's F12 medium containing 10% fetal bovine serum (FBS), an antibiotic/antifungal agent and G418. CHO cells overexpressing the rat S1P₂ gene were cultured in a Ham's F12 medium containing 10% FBS, penicillin/streptomycin and blasticidin S. The cultured cells were incubated in a Fura2-AM solution (5 μ M) [a Ham's F12 medium containing FBS (10%), HEPES buffer (20 mM, pH 7.2 to 7.5) and probenecid (2.5 mM)] at 37° C. for 60 minutes. The cells were washed twice with a Hanks' balanced saline containing HEPES buffer (20 mM, pH 7.2 to

65

7.5) and probenecid (2.5 mM) and immersed in the same solution. A plate was mounted on a fluorescence-based drug screening system and the intracellular calcium ion concentration was measured for 30 seconds without stimulation. A test substance (the final concentration of human S1P₂: 0.25 nM to 25 μM and the final concentration of rat S1P₂: 0.25 nM to 2.5 μM) or a dimethyl sulphoxide (DMSO) solution was added and after 3 minutes S1P (final concentration: 300 nM) was added and the increase in the intracellular calcium ion concentration before and after the addition of S1P was measured with an interval of 3 seconds (excitation wavelength: 340 nm and 380 nm, fluorescence wavelength: 540 nm).

The S1P₂ antagonistic activity was calculated using the suppression obtained from the following formula, wherein A is a control value which was a peak value after addition of S1P (final concentration: 300 nM) in the wells added with DMSO without a test substance and B is an increased amount after addition of S1P in the cells treated with the test substance:

$$\text{Suppression(\%)} = [(A-B)/A] \times 100 \quad [E\ 1]$$

IC₅₀ value was calculated as the concentration of the present compound which showed the 50% suppression.

Comparative compounds used were the compounds disclosed in Example 1(64) (hereinafter referred to as comparative compound A) and Example 1(85) (hereinafter referred to as comparative compound B) in Patent Document 3 (WO 2004/002531). The structural formulae of the comparative compounds are shown below respectively.

[C 25]

Comparative compound A

[C 26]

Comparative compound B

The human and rat S1P₂ antagonistic activities of the present compounds and comparative compounds are shown in the following Table 4.

66

TABLE 4

Compound	S1P ₂ antagonistic activity IC ₅₀ (nM)	
	Human	Rat
Comparative compound A	1600	72
Comparative compound B	1200	27
Example 15(1)	7.0	9.6
Example 9(3)	6.2	3.3
Example 15(6)	5.1	5.0
Example 9	2.3	2.5
Example 13	3.0	3.0
Example 19	9.4	1.7
Example 38	3.4	1.0

As a result, it was found that the present compounds have significantly improved human S1P₂ antagonistic activity compared to the comparative compounds. In addition, the present compounds also have improved difference in the S1P₂ antagonistic activity between species, i.e. between human and rat and thus may allow extrapolation of the efficacy obtained in rat pathological models to human.

Physical Experimental Example 2

Solubility Measurement

A solution for obtaining a calibration curve was prepared by diluting a test substance (10 mmol/L, DMSO solution) in acetonitrile and adding acetonitrile containing an internal standard substance (warfarin) to adjust to 0.1, 0.4 and 2 μmol/L. A sample solution was prepared by adding to 495 μL (pH 6.8) of the second solution defined in Japanese Pharmacopoeia (a solution used was obtained by adding water to 250 mL of a 0.2 mol/L potassium dihydrogen phosphate reagent solution and 118 mL of a 0.2 mol/L sodium hydroxide reagent solution to adjust to 1000 mL) 5 μL of a test substance (10 mmol/L, DMSO solution), stirring at room temperature for 5 hours, transferring the obtained solution to a plate with a filter for vacuum filtration, diluting 20 μL of the filtrate with acetonitrile and adding acetonitrile containing the internal standard. The solution for obtaining a calibration curve and the sample solution (5 μL each) were injected to LC-MS/MS (Discovery Max from Thermo Scientific) for quantification (quantification range: 0.1 to 2 μmol/L). The solubility was calculated by multiplying the quantified value by 50. When the calculated value was outside of the quantification range, the solubility was expressed as <5 μmol/L or 100 μmol/L.

The solubility of the present compounds and the comparative compounds is shown in the following Table 5.

TABLE 5

Compound	Solubility (μmol/L)
Comparative compound A	<5
Comparative compound B	<5
Example 9(1)	80.3
Example 9(3)	90.1
Example 9	77.2
Example 19	78.3
Example 38	70.0

As a result, it was found that the present compounds have superior solubility than the comparative compounds.
